5 Abstract

10 A wear pad for insertion between a load to be lifted
and a lifting device, such as a chain or wire cable of a
crane, hoist or other lifting device, containing a
cylindrical-shaped edge protector with a cut out section and
raised edges on the outside surface of each cylindrical end
of the edge protector, which edges extend around the
circumference of the edge protector. The wear pad may
further include an attachment element for attaching the edge
protector to the load being lifted by the lifting device,
15 such as a magnet.
